EDUCATION

Brown University

M.S. in Computer Science, GPA: 4.0

Providence, RI

Expected: May 2027

Carleton College

B.A. in Computer Science and Mathematics, Major GPA: 3.92

Northfield, MN

Graduation: March 2025

- Relevant Coursework: High-Performance Network Systems, Distributed Systems, Algorithms, Computer Graphics, Data Structures, Large Language Models, Cryptography, Security

EXPERIENCE

Cloudflare

Austin, TX

Software Engineer Intern

May 2026 – Aug 2026

- Built and deployed a cost-aware LLM router by training a ModernBERT-based model quality predictor and containerized it for serverless GPU service, achieving sub-200 ms inference latency
- Deployed and benchmarked Kimi K3 with DSpark speculative decoding on B300 Kubernetes clusters, leveraging SGLang and Mooncake prefill-decoding disaggregation to improve tokens per second by 108%
- Drove end-to-end delivery of Dynamic Pages across six Kubernetes services, enabling 3,000+ enterprise accounts to customize Access login and block pages as sandboxed templates with request-time context
- Designed the global publishing pipeline, propagating durable PostgreSQL change records to edge KV within 500 ms while serving custom pages at sub-200 ms p95 latency

Z.ai

Remote

Software Engineer Intern

Dec 2025 – Feb 2026

- Automated traceable financial-report creation by building a GLM-5-powered GraphRAG system that synthesizes source-backed analysis across 100K+ knowledge graph entities, cutting manual research from hours to minutes.

Flowith

San Francisco, CA

Software Engineer Intern

Mar 2025 – Aug 2025

- Owned the server-to-edge migration, shipping 27 endpoints for agent workflows and RAG knowledge bases while sustaining sub-100 ms p95 edge-processing latency and 99.95% availability.
- Built entitlement and rate-limiting controls for premium AI features, combining Supabase plan validation, Redis request limits, and D1 model quotas to govern 20K+ daily requests across three subscription tiers

QuantInfinite

Shanghai, China

Software Engineer Intern

Jun 2024 – Sep 2024

- Shipped a Flutter cross-platform portfolio manager tracking 5,000+ stocks, reducing view render time from 80 ms to 20 ms through async gRPC data handling, memoization, and granular Riverpod state updates

PROJECTS

Tundra | Rust, Memcached, Network Programming, Distributed Systems

- Implemented Tundra, a multithreaded communication library of composable message stream transformations, enabling developers to optimize communication with precise control on networking guarantees
- Increased Memcached throughput by 30%, cut latency by 20%, and reduced the networking codebase by 5×

KVonset | Rust, epoll, Lock-Free Concurrency, Systems Programming

- Built a high-performance in-memory key-value store in Rust using edge-triggered epoll, multithreaded accept, and a nonblocking I/O state machine
- Designed a hybrid lock-free storage layer combining a hot-key cache with a sharded concurrent hash map, achieving 335K keys/s throughput with p95 latency under 170 μ s

SKILLS

Languages: TypeScript, Python, Rust, Go, C, Dart, SQL, Bash

Frameworks: React, FastAPI, Hono, Flutter, Riverpod, Tokio, PyTorch, Pandas

Infrastructure: SGLang, PostgreSQL, SQLite, Supabase, Neo4j, Redis, Memcached, gRPC, Docker, Kubernetes
